

Pushing Transgenderism in school harms children

**Let's stop confusing
children in New Brunswick
classrooms!**

Gender Ideology in schools often leads to chemical & surgical mutilation

- A study published in 2022 found that almost two-thirds of young children who identified as “transgender” ended up using puberty blockers or cross-sex hormones.
- Puberty blockers, high dose estrogen and testosterone are powerful drugs which can cause irreversible infertility, make bones brittle, stunt a child’s growth, reduce brain volume, increase the risk of cardiovascular disease, blood clots and various cancers.
- Many children who suppress puberty and take cross-sex hormones, end up deciding later to undergo “top” or “bottom surgery” to remove perfectly healthy body parts.
- A 2023 study found that hundreds of Canadian girls aged 17 and younger underwent double mastectomies over the past five years.

Together, let’s stop this child abuse!
